-26-

CLAIMS:

1.   An improved hybrid method of bidirectional GPS and Cellular/PCS that
can use GPS signals itself by receiving it with a receiver and pass it
5   through GPS(2) and save the data in the EEPROM(4) through the Signal
Hybrid/Processor(3) to perceive the present coordinates of a user in
current Cellular/PCS and use it in a local or in a network as database,
or can retransmit the location signal connected with current Cellular/PCS.

10   2.   An hybrid method that can process coordinates signal, time, and ID
with status and movement of variety external devices.

3.   A hybrid method where the coordinates converted to ASCII in a
database on a network lets user that address(street number, etc.) of real
15   location with user ID(a) be displayed to user(b) through Receiver(B) →
RF/IF(C) → Baseband Processor(D) → Display Device(7) after coordinates
of User(a) is transmitted through Transmitter(I) → Antenna(A) in time
when user(a) calls another user(b).

20   4.   A perfect ID card and payment method by verifying time and location
data(coordinates, time, and ID) on the network using one of the methods
mentioned in Claim 1 or 3 to substitute the imperfect ID card system and
credit card system.

25   5.   A hybrid method that perform intellectual multipurpose function by
implementing a variety of data gained by one of the methods mentioned in
claim 1 of claim 4 to the database on the network.

-27-

6.   An improved hybrid system of bidirectional GPS and Cellular/PCS that can use GPS signals itself by receiving it with a receiver and pass it through GPS(2) and save the data in the EEPROM(4) through the Signal Hybrid/Processor(3) to perceive the present coordinates of a user in current Cellular/PCS and use it in a local or in a network as database, or can retransmit the location signal connected with current Cellular/PCS.

7.   A hybrid system that can process coordinates signal, time, and ID with status and movement of variety external devices.

8.   A hybrid system where the coordinates converted to ASCII in a database on a network lets user that address(street number, etc.) of real location with user ID(a) be displayed to user(b) through Receiver(B) → RF/IF(C) → Baseband Processor(D) → Display Device(7) after coordinates of User(a) is transmitted through Transmitter(I) → Antenna(A) in time when user(a) calls another user(b).

9.   A perfect ID card and payment system by verifying time and location data(coordinates, time, and ID) on the network using one of the methods mentioned in Claims 6 to 8 to substitute the imperfect ID card system and credit card system.

10.   A hybrid system that perform intellectual multipurpose function by implementing a variety of data gained by one of the methods mentioned in claims 6 to 9 to the database on the network.
